### Benefits

- Available with impurity specification of less than 1 ppm or less than 50 ppb.
- For final target concentration ranges from 5E+17 to 5E+19 of Magnesium.
- Uniform Coatings
- High purity materials

### Typical Application

The concentration of the source for driving-in is typically high; in the range of 4E+21 this leaves a high concentration of dopant right at the surface. During drive in the dopant diffuses into the substrate. Mg-210P has a film concentration of 4E+21 Magnesium atoms per cubic centimeter. This addition of Magnesium eliminates any concentration gradient that may exist and prohibits the loss of magnesium through the surface layer.

### Packaging

- 240ml
- 500ml
- 1 L
- 2.5 L
- 4 L

### Alternative Products

Mg-210N
Other target concentration levels available.

### Elements Available to Add

- As
- Sb
- Bi
- Other elements available for compound semiconductor use
